

Planning application capability enhancement

The Client:

“BAE Systems is the premier global defence and aerospace company”

A global leader in the provision of military capabilities and systems. BAE Systems are bringing supply chain tools and techniques to the UK Government and Armed Forces

The Problem:

The Client is in the process of expanding an existing Customer contract with significant changes from the original requirements identified in 2001. These are to :

- Maximise fleet availability
- Enable achievement of KPI's to forward
- Increase the efficiency of supplier and subcontractor relationships
- Enhance strategic partnerships
- Optimise organisational structure currently in place

Our approach:

Through a Discovery process, we understood the Clients strategic objectives and targets for future expansion.

We studied the Clients current planning processes, data feeds and utilisation of the functionality available to them within their Xelus application.

We provided a detailed set of recommendations regarding configuration changes, parameter settings, and user training programs to help make them self sufficient in the future.

The results:

Significant changes to the existing Xelus installation were identified to support the current contract and the future changes to Cross Platform and Fleet Availability.

These included business direction, data integration and system settings and parameters. A structured 'Get Well' package is now in place to work to the end vision for the Customer contract support.
